Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                              The present sequence is that of one the four isoforms of Api m 6, designated Api m 6.01. The sequence represents the central amino acid sequence shared by all four isoforms (see ABB08313, ABB08313 and ABB08332 and ABB08332 and ABB08333. The specification describes a substantially pure polypeptide, Api m 6, derived from bee venom and found in four isoforms. The proteins of the invention have immunosuppressant activity and may form the basis of a vaccine. Api m 6 is useful for modulating an immune response, i.e. as an allergen for immunotherapy. The protein is useful for identifying an individual at risk for bee venom hypersensitivity. The method comprises administering Api m 6 to the individual and measuring an immune response raised, where a detectable immune response indicates that the individual is at risk for bee venom hypersensitivity. Antibodies specific for Abi m 6 are useful for purifying the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bee venom; isoform; immunosuppressant; vaccine; Api m 6; immune response; bee venom hypersensitivity; antibody; protein purification; Api m 6.02;

                               designated Api m 6.02. All four isoforms share a common central amimo acid sequence shared by all four isoforms (see ABB08330, ABB08332 and ABB08333). The specification describes a substantially pure polypeptide, Api m 6, derived from bee venom and found in four isoforms. The proteins of the invention have immunosuppressant activity and may form the basis of a vaccine. Api m 6 is useful for modulating an immune response, i.e. as an allergen for immunotherapy. The protein is useful for identifying an individual at risk for bee venom hypersensitivity. The method comprises administering Api m 6 to the individual and measuring an immune response raised, where a detectable immune response indicates that the individual is at risk for bee venom hypersensitivity. Antibodies specific for Abi m 6 are useful for purifying the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          venom; isoform; immunosuppressant; vaccine; Api m 6; immune response; venom hypersensitivity; antibody; protein purification; Api m 6.03;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 GGFGGLGGRCKCPSNEIFSRCDGRCQRFCPNVVPKPLCIKICAPGCVCRLGYLRNKKKVC 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of one the four isoforms of Api m 6, designated Api m 6.03. All four isoforms share a common central amimo acid sequence shared by all four isoforms (see ABB0833), ABB08331 and ABB08333). The specification describes a substantially pure polypeptide, Api m 6, derived from bee venom and found in four isoforms. The proceins of the invention have immunosuppressant activity and may form the basis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New bee venom polypeptides, useful for modulating immune responses e.g. in individual hypersensitive to the venom and for identifying individual at risk for bee venom hypersensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 GGFGGLGGRGKCPSNEIFSRCDGRCQRFCPNVVPKPLCIKICAPGCVCRLGYLRNKKKVC
present sequence is that of one the four isoforms of Api m 6,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

ö
of a vaccine. Api m 6 is useful for modulating an immune response, i.e. as an allergen for immunotherapy. The protein is useful for identifying an individual at risk for bee venom hypersensitivity. The method comprises administering Api m 6 to the individual and measuring an immune response raised, where a detectable immune response indicates that the individual is at risk for bee venom hypersensitivity. Antibodies specific for Abi m 6 are useful for purifying the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of one the four isoforms of Api m 6, designated Api m 6.04. All four isoforms share a common central amimo acid sequence shared by all four isoforms (see ABB08330, ABB08331 and ABB08332). The specification describes a substantially pure polypeptide, Api m 6, derived from bee venom and found in four isoforms. The proteins of the invention have immunosuppressant activity and may form the basis of a vaccine. Api m 6 is useful for modulating an immune response, i.e. as an allergen for immunotherapy. The protein is useful for identifying
                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                            64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New bee venom polypeptides, useful for modulating immune responses e.g. in individual hypersensitive to the venom and for identifying individual at risk for bee venom hypersensitivity

ö
an individual at risk for bee venom hypersensitivity. The method comprises administering Api m 6 to the individual and measuring an immune response raised, where a detectable immune response indicates that the individual is at risk for bee venom hypersensitivity. Antibodies specific for Abi m 6 are useful for purifying the protein.
                                                                                                                                                                                               09

PX3.101 inhibits the binding of interleukin: 8 (II-8) to its receptor (e.g. CXCR1 and CXCR2) and inhibits a variety of enzymes (e.g. cyclooxygenases, lipoxygenases, phospholipases and proteases) associated with inflammatory diseases.

The nucleic acids may be used for the recombinant production of PX3.101 proteins either in vivo (as part of a gene therapy proteool)

or in vitro (as a fermentation culture). The nucleic acids may also can seed as probes to identify similar sequences in samples. The PX3.101 protein may be used for the treatment of inflammatory diseases, cancers, autoimmune diseases, pain and/or diseases associated with chemokine (especially IL-8) imbalances such as rheumatoid arthritis, multiple sclerosis, psoriasis, systemic lupus erythematosus (SLB), Crohn's disease, vasculitis, scleroderma, metastatic cancer and Alzheimer's disease, in humans. It is also disclosed that the proteins may be used to accelerate wound healing, reduce several aging processes and protect against ultraviolet light. The proteins may also be used as antigens in the production of antibodies specific for PX3.101. The antibodies may come used as diagnostic agents to detect PX3.101 protein in samples and
                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of derecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention

Porcine sperm proteins which bind the zona pellucida in a species-specific manner were isolated. Separation by gel electrophoresis resulted in bands of proteins with molecular weights of 130, 150 and 170 kD, under native conditions but bands of 105 and 45 kD were observed when the proteins were separated under denaturing conditions. Compounds which bind these proteins can be used for contraception or fertilisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving contrating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disposition for gene mapping, identification of mutations responsible for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human and manner and an annowable of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1623 ECPPNSHYELCADTCSLGCSALSAPPQCQDGCAEGCQCDSGFLXN-GQACVPIQQCG 1678

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is encoded by fragment 13 which is a Notl/KpnI fragment from DNV11-ST. This sequence represents a portion of the IgG-FC binding protein of human colonic epithelium. This sequence was used in the isolation of the full length sequence given in AAM14749. mRNA isolated from human colonic epithelial tissue was used to prepare a CDNA library. This was screened using monoclonal antibodies K9 and K17 which bind to the large and small components of the binding protein. Active clones, see also AAM63077-81, were used to derive probes for screening a second DNA library from human colonic epithelial tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11 KCPSNEIFSRCDGRCQRFCPNVVPKPLCIKICAPGCVCRLGYLRNKKKVCVPRSKCG 67

The present invention describes compounds (1) for the immunotherapy and diagnosis of colon cancer. Also described: (1) a method for detecting the presence of cancer in a patient; (2) a method for stimulating and/or expanding T cells specific for a tumour protein; (3) an isolated T cell population comprising T cells prepared by the method of (2); (4) a method for stimulating an immune response in a patient; (5) a method for treating cancer in a patient; and (6) a method for inhibiting the development of cancer in a patient. (1) have immunostimulant and evelopment cancer in a patient. (1) have immunostimulant and avbressit to ABPS5343 to ABPS5349 I represent human colon cancer/tumour related sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1531 ECPPNSHYELCADICSLGCSALSAPPQCQDGCAEGCQCDSGFLYN-GQACVPIQQCG 1586
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11 KCPSNEIFSRCDGRCQRFCPNVVPKPLCIKICAPGCVCRLGYLRNKKKVCVPRSKCG 67

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ĥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the IgG-Fc binding protein of human colonic epithelium. This sequence was isolated using the sequence given in AAW14748. mRNA isolated from human colonic epithelial tissue was used to prepare a cDNA library. This was screened using monoclonal antibodies K9 and K17 which bind to the large and small components of the binding protein. Active clones, see also AAT63077-81, were used to derive probes for screening a second DNA library from human colonic epithelial tissue.

polymuclecides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to toreat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polymeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polymeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO.

for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) as useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disposities, forenists, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human confidence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and in ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold alevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                     57

3,
              The present sequence is the Ancyclostoma caninum nematode-extracted anticoagulant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be inhed to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by mematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5 QCGENEKYDSCGSKECDKKCKYDGVEEEDDEEFNV---PCLVRVCHQDCVCEEGFYRNKD 61

OR PROMOTING ADHESION TO THE OVIDUCTAL ISTHMUS.
DOMAIN: The VWFD domain 2 may mediate covalent oligomerization (by similarity to human intestinal mucin MUC2).
SIMILARITY: Contains 3 MAM domains.
SIMILARITY: Contains 4 VWFD domains.
SIMILARITY: Contains 1 EGF-like domain.
SIMILARITY: Contains 1 EGF-like domain.
CAUTION: Ref. 2 sequence differs from that shown due to transposition of a number of exons.
                                                                                                                                                                                                                                                                                                                                                                                                                                   zonadhesin gene (ZAN).";
Genomics 41:119-122(1997).
-!- FUNCTION: BINDS IN A SPECIES-SPECIFIC MANNER TO THE ZONA PELLUCIDA OF THE EGG. MAY BE INVOLVED IN GAMETE RECOGNITION AND/OR SIGNALING.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN, EXCLUSIVELY ON THE APICAL REGION OF THE SPERM HEAD (BY SIMILARITY).

-!- PTM: MAY BE CONVERTED INTO THE 260 kDa MATURE HEMOCYTIN BY PROTEOLYSIS.
-!- SIMILARITY: TO MAMMALIAN VON WILLEBRAND FACTOR.
-!- SIMILARITY: THE N-TERMINAL DOMAIN SHOWS SOME SIMILARITY TO THAT OF HUMAN WICHN 2.
-!- SIMILARITY: CONTAINS 2 FEVY C domains.
-!- SIMILARITY: CONTAINS 2 VWFC domains.
-!- SIMILARITY: CONTAINS 1 C-terminal cystine knot-like (CTCK) domain.

"The molecular structure of the complex of Ascaris
chymotrypsin/elastase inhibitor with porcine elastase.";
Structure 2:679-689(1994).
-!- FUNCTION: Defend the organism against the host's proteinases.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Contains 1 TIL (Trypsin inhibitory-like) domain.
                                                                                                       3;
